

Breakthrough Prostate Cancer Diagnosis and Treatment Option Now Available at Cancer Partners and Urology Partners of Nebraska

According to the Nebraska Cancer Registry, prostate cancer is the top diagnosed cancer in Nebraska. To aid in diagnosing and treating this cancer, Cancer Partners and Urology Partners are teaming up to offer patients a new and innovative procedure called the Promaxo MRI System, which enhances the detection and treatment of aggressive prostate cancer while prioritizing patient comfort and convenience.

The introduction of the Promaxo MRI System marks a significant advancement in prostate cancer diagnosis and treatment. This cutting-edge technology offers improved accuracy and precision all within a clinic setting.

One of the key benefits of the Promaxo MRI System is the elimination of the need for a transrectal biopsy. "This not only enhances patient comfort but also leads to more accurate targeting of lesions and superior cancer detection rates" adds Dr. Adam Mues, urologic oncologist at Urology Partners of Nebraska.

Urology Partners also recently announced another cutting-edge therapy, called Aquablation, for men suffering from Benign prostatic hyperplasia (BPH). With Aquablation, the urology team uses a no-incision, no-heat procedure to target and remove the obstructing tissue of the enlarged prostate. This innovative therapy provides long-term relief of BPH symptoms with a low risk of side effects or complications.

Both the Promaxo MRI System and Aquablation therapy are currently administered by the experts at Urology Partners at the April Sampson Cancer Center. For questions about the benefits of either treatment, contact Urology Partners at 402-413-2800 or visit urologypartners.com or cancerpartners.com.
